

## Winchester Center for Lung Disease

The Winchester Center for Lung Disease provides patients with lung disorders a state-of-the-art approach to evaluation and treatment. Some patients come to us seeking an explanation for unexplained respiratory symptoms while others need care for chronic lung diseases.

Our specialists are faculty members of the Yale School of Medicine Section of Pulmonary, Critical Care and Sleep Medicine. They are board-certified pulmonary physicians with national and international expertise in treating even the most challenging lung conditions. They collaborate with clinical experts in allergy and immunology, otolaryngology (ears, nose and throat), gastroenterology (digestive problems), rheumatology (joint and autoimmune problems), thoracic surgery (surgeons who specialize in disorders of the lungs, esophagus, and chest), thoracic oncology (e.g. lung cancer), physical therapy, respiratory therapy, nutrition, social work, radiology and pulmonary pathology to diagnose and treat respiratory conditions. They also participate in cutting-edge clinical research aimed at improving treatment and diagnosis of lung disease.

In addition, the Winchester Center for Lung Disease performs extensive testing through its [Pulmonary Function Testing](#) to determine how well the lungs are functioning.

### **Post-COVID RECOVERY Program**

Medical experts are seeing many survivors of COVID-19 who continue to experience respiratory and other symptoms well after their general recovery from the disease. In response to this problem, the [Recovery Program](#) was the first in Connecticut to offer multidisciplinary evaluation and treatment to people with persistent shortness of breath, difficulty with exercise and usual daily activities, cough and chest discomfort. Our Program is open not only to those who required hospitalization for their initial illness, but also those with milder disease who have gone on to experience persistent, chronic symptoms.

Since 2020, our pulmonary experts, physical therapists and social worker have worked closely with colleagues in neurology, cardiology, psychiatry and other medical specialties to provide personalized evaluation and treatment plans. Our Program also participates in clinical research aimed at better understanding how to address these challenging symptoms and we collaborate with similar clinics across the country.

If you or a loved one has been diagnosed with COVID-19, your primary care physician may refer you to a Yale New Haven Health facility for monoclonal antibody treatment.
